What changed in week 43

Report updates, the planned AI design, and how models are called

1 · DONE THIS WEEK

Six changes to the report

Comparisons

Criteria TC1–TC9; 22 tables, each choice against 2–3 alternatives

Judge evidence

12 sources re-read, 3 misquotes fixed; we measure, not assume

AI-native loop

Five-step core loop: what remains when AI is removed

Chapter 7

Frontend and backend measured; AI evaluation fixed in advance

Deployment

Redrawn in UML; observability watches every node

Data policy

New §5.3.10 on processing and third parties

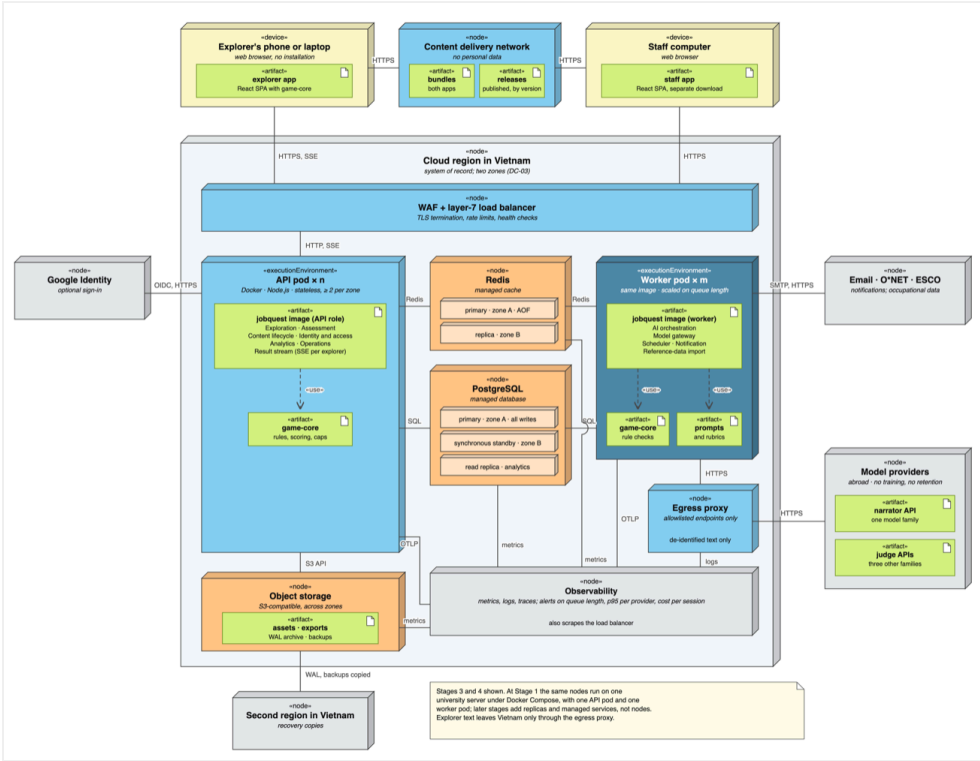

Chapter 7: measured, not assumed

	Tool	Result	Status
Frontend speed	Lighthouse, 8 pages × 5 runs	58 mobile, 85 desktop	Not met on mobile
Accessibility	Lighthouse audit	92 to 100	Partly
Backend load	k6, 50 to 1,000 players	0 errors, p95 ≤ 23 ms	Met, one process
Capacity	k6, open model	600–800 req/s vs 300	Assumption holds
AI scoring	Keyword grader pilot	QWK 0.30 vs 0.70	Judges not run yet

Deployment in UML notation

What changed

- Nodes, artifacts, protocols on links
- Observability takes data from all six
- Models abroad only via egress

“Nhóm không phải design, build hay fine-tune mô hình nhé. Quan trọng là problem được solve hiệu quả thế nào nhé.”

—Cô Võ Thị Ngọc Châu, email 20/10/2026

Planned structure of §5.3.6

- Design principles
- End-to-end flow
- Model or rule, per decision

- AI-1 to AI-5 contracts
- Feedback, other free text
- Seed and judgment data

- Scoring, edge cases
- Call setup, prompts
- Run-time rules

- Privacy, §5.3.10
- Failure, cost, time
- Feedback loop, deferred AI

Changed since your reply

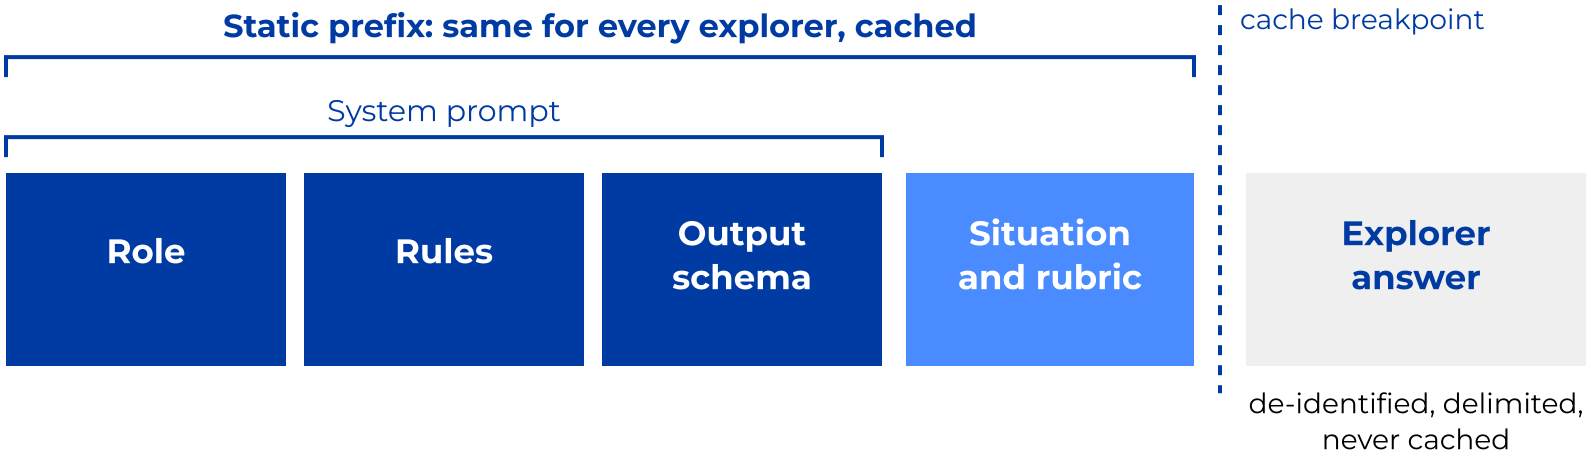

- AI-1 to AI-5 detail moved from §5.2.3 to §5.3.6
- Prompts and decoding became **model call configuration**
- New: **prompt caching**, set per provider
- New §5.3.10: **policy for processing and third parties**
- Judge consistency is now measured, no longer assumed

Structure now, numbers later

We ask you to agree on the structure, not on the figures. Formulas stay as parameters until the game rules are fixed. Models are provisional. Every threshold was set before any model runs, and Chapter 7 will confirm or replace each number.

One gateway, one prompt order

Code asks for a role, never a provider; templates are versioned and pinned to each run.

A profile for each kind of call

	Model	Output	Sampling	Time limit
AI-4 narration	qwen3.8-flash	300 tokens	T 0.7, no thinking	4.5 s
AI-5 judge	3 families	600 tokens	T 0 or default	7 s
Feedback	Narrator	400 tokens	T 0.3	6 s
AI-1 interview	Authoring	400 tokens	T 0.5, low effort	20 s
AI-2 seed draft	Authoring	8,000 tokens	T 0.2	120 s, batch
Log review	Other family	1,000 tokens	T 0	Daily

Two facts shape the setup

No temperature

Since 21/10/2026, Anthropic refuses a temperature. So the judge's repeatability is measured over three runs, not assumed.

Cache the prefix

Situation and rubric repeat for every explorer. On a cache hit, the judge pays about a fifth of its input cost.

Calling models abroad

De-identify first

Names and contacts removed in Việt Nam before a call

Still a transfer

Consent and an impact assessment, as Law 91/2025 asks

Provider terms

No training on our data; retention confirmed in writing

One exit

An egress proxy logs every call that leaves the country

What we need from you

- Is composing existing models the right scope?
- Does the four-group structure of §5.3.6 fit?
- Should call setup and caching stay in §5.3.6?
- Is "de-identify, yet treat as transfer" acceptable?
- Where do the six AI-native criteria come from?

Thank you

Questions and direction for the AI design

Report: §5.3.6, §5.3.10, Chapter 7
